

Does this seem familiar to you ?

The grave candle housing has caught fire, the wax has been spilt over the grave lantern and the panes of the lantern are damaged! A repair of the grave lantern can cost up to € 130, the damage to the surrounding natural stone is irreparable in most cases!

We have the solution: THE GRAVE LANTERN PROTECTION BEAKER

The grave lantern protection beaker for grave lights is made of transparent heat-resistant laboratory glass, Borosilicate glass 3.3 according to DIN ISO 3585. A burning grave candle housing or leaking wax cannot damage it, and therefore also the lantern or the surrounding natural stone.

Since this is manufactured in two sizes (dimensions see below), all standard grave lights can be used. You place your grave light in the grave lantern protection beaker, light it and put both together in your grave lantern. **FINISHED!**

The grave lantern protection beakers are available in two sizes:

- G3: Diameter 65mm / 61mm,
Height 100mm, for
3-Day-Burner-Candles

- G7: Diameter 75mm / 71mm,
Height 150mm, for
7-Day-Burner-Candles
